

KAIR Project Management System – Task Distribution Document

Project Overview

The KAIR Project Management System is a desktop application built using Java, JavaFX, and MySQL. The system allows users to create projects, organize tasks, manage teams, and visually track progress using a Kanban board. It also includes authentication screens, dashboards, database connectivity, and a custom-designed user interface styled to resemble modern project management tools.

The system aims to simplify project creation, team assignment, task monitoring, and overall workflow visualization.

Key Features of the System

- **User Authentication:** Login and Signup pages connected to the database for user verification.
- **Dashboard:** Displays summaries such as active projects, completed tasks, and team members.
- **Project Creation:** Popup window that allows users to create new projects and assign team members.
- **Project List:** A dedicated popup page that displays all created projects in table format.
- **Kanban Board:** Allows users to manage tasks using drag-and-drop functionality across columns (To Do, In Progress, Done).
- **Task Popup:** Interface for adding new tasks to the Kanban board.
- **Team Dashboard:** Displays users and team assignments from the database.
- **Database Integration:** MySQL database storing users, projects, tasks, and team relationships.
- **Custom Top Bar:** Replaces the default window bar for a sleek design (minimize, exit, and drag window).

- UI/UX Design: Clean, modern interface consistent across all application pages.

Task Distribution

Felicity Espina – Project & Kanban Functionality Development

- Implemented the Create Project Popup, including UI layout, input validation, and field logic.
- Developed the Project List Popup, including table structure, column bindings, and list updating.
- Implemented drag-and-drop functionality for Kanban tasks, enabling movable cards between columns.
- Coordinated the integration of project creation into the Kanban workflow.

Jacob Shen Riesgo – UI/UX, Kanban Board, Task System, and Testing

- Served as the primary UI/UX designer for the overall layout and user interface consistency.
- Implemented the custom top bar, including window dragging, minimize, and close functionality.
- Designed and developed the Kanban Board, including columns, cards, and task interactions.
- Built the Task creation popup and task management logic.
- Led system testing, verifying usability, responsiveness, and feature functionality.

Luigi Ariola – Authentication and Dashboard Development

- Designed and developed the UI/UX for Login and Signup screens.
- Implemented functional logic for user input, navigation, and form handling.

- Designed and built the Dashboard interface, including project summaries and navigation tabs.
- Ensured consistent UI styling across authentication and dashboard pages.

Miguel Mendoza – Database & Backend Integration

- Designed and created the MySQL database schema, including users, projects, tasks, and relationships.
- Implemented DatabaseConnection and UserDAO, handling database operations and user retrieval.
- Developed the Team Dashboard UI and controller, integrating database-driven team data.
- Built the ViewProjects page, connecting frontend components with stored project records.
- Ensured stable and secure communication between JavaFX and MySQL.
